We made substantial revisions to our project based on the feedback we received from teams 4 and 6. Their comments suggested that we explain our proposal in more detail and state the problem with a little more accuracy. We were able to hone in on our objective using those comments and set limitations on what we wanted to cover with our report. A greater detail of the algorithms we discussed in our draft report was also added. Both groups commented that they would like more information on the algorithms and that we should explain them better as well. Team 4 advised that we discuss the application of these algorithms further to present a more formal solution to our problem using the suggested algorithms. These applications of our algorithms show the specific use-case scenarios for the algorithms in our proposed system. Adding the discussion and specifics of the geo-coding portion improved the overall flow of our report. We also added a large amount of content that we felt was necessary to our proposed system and gave a detailed proposal for implementation and testing as well as possibilities for future integration of emerging emergency reporting resources such as text messages and social media.
